File Organization Technique- Single and Two level directory

AIM:

To implement File Organization Structures in C
are a. Single Level Directory
b. Two-Level Directory
c. Hierarchical Directory Structure
d. Directed Acyclic Graph Structure

a. Single Level Directory

ALGORITHM

1. Start
2. Declare the number, names and size of the directories and file names.
3. Get the values for the declared variables.
4. Display the files that are available in the directories.
5. Stop.

PROGRAM:

```
#include <stdio.h>
#include <string.h>

#define MAX_FILES 100
#define MAX_NAME 50

int main() {
   char files[MAX_FILES][MAX_NAME];
   int n, i;

   printf("Enter the number of files: ");
   scanf("%d", &n);

   for (i = 0; i < n; i++) {
```

```
        printf("Enter the file %d: ", i + 1);
        scanf("%s", files[i]);

        printf("\nCurrent Directory Structure:\n");
        printf("Root Directory\n");

        if (i == 0) {

            printf("   |\n");
            printf("   --> %s\n", files[0]);
        } else {

            for (int j = 0; j < i; j++) {
                printf("  /");
            }
            printf("\n");

            for (int j = 0; j <= i; j++) {
                printf("%s  ", files[j]);
            }
            printf("\n");
        }

        printf("\n");
    }

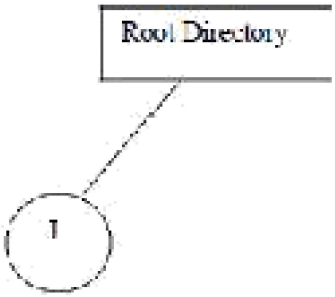
    return 0;
}
```

OUTPUT:

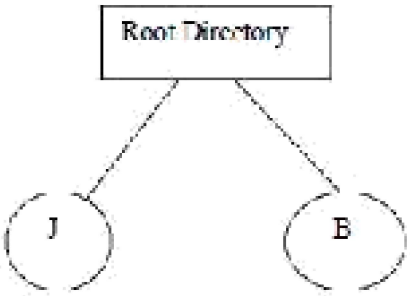
Enter the Number of files

2

Enter the file1 J



Enter the file2 B



b. Two-level directory Structure

ALGORITHM:

1. Start
2. Declare the number, names and size of the directories and subdirectories and file names.
3. Get the values for the declared variables.
4. Display the files that are available in the directories and subdirectories.
5. Stop.

PROGRAM:

```
#include <stdio.h>

int main() {
   char user[20], subDir[20], file[20];
   int users, files;
```

```
    printf("Enter the name of dir/file(under null): ");
    scanf("%s", user);

    printf("How many users(for %s): ", user);
    scanf("%d", &users);

    for (int i = 0; i < users; i++) {
        printf("Enter name of dir/file(under %s): ", user);
        scanf("%s", subDir);

        printf("How many files(for %s): ", subDir);
        scanf("%d", &files);

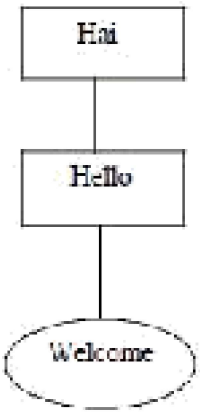
        for (int j = 0; j < files; j++) {
            printf("Enter name of dir/file(under %s): ", subDir);
            scanf("%s", file);
        }

        // Print the structure
        printf("\nDirectory Structure:\n");
        printf("%s\n", user);
        printf(" |\n");
        printf("%s\n", subDir);
        printf(" |\n");
        printf("%s\n", file);
    }

    return 0;
}
```

Sample Output:

```
Enter the name of dir/file(under null): Hai
How many users(for Hai):1
Enter name of dir/file(under Hai):Hello
How many files(for Hello):1
Enter name of dir/file(under Hello):welcome
```



Result:

Thus,the file organisation technique has been successfully executed.
